

# Bathing Water Pollution Risk Forecasting Update

- ➡ Overview of PRF process
- ➡ Development work 2018/19
- ➡ 2020 Forecasting System

Dr Deborah Tyrrell  
Technical Specialist – Marine Modelling  
Environment Agency  
December 2019

# EA Pollution Risk Forecasting Process

## MODELLING

Data management  
Model build and validation  
Model export  
In season tracking

## FEWS SYSTEM

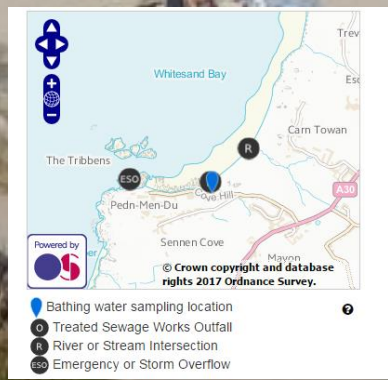

Real-time automated daily forecast  
Data capture  
Data visualisation and export

## FORECAST

### DISSEMINATION

Environment Agency  
Data Explorer  
Text messages  
Email notifications

## BEACH

### MANAGEMENT

Beach signage  
Electronic signs

# Water Quality Variables

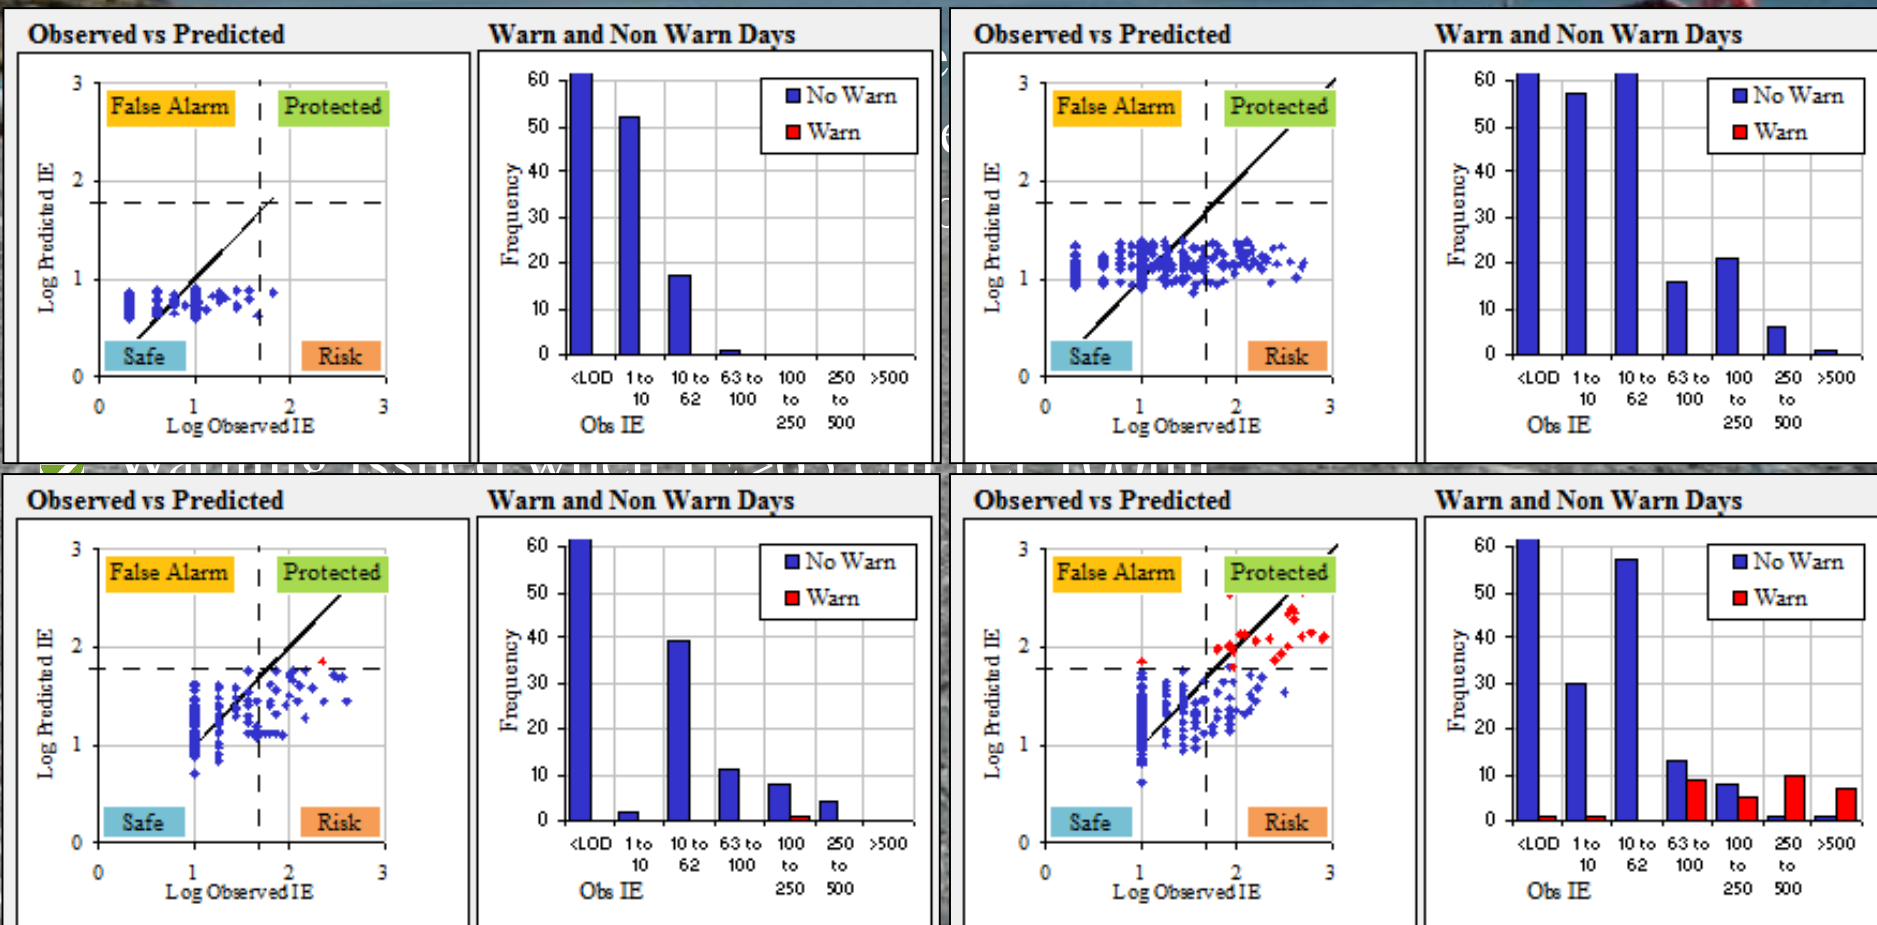

# Multiple Linear Regression (MLR)

- ➡ Up to 40 variables are entered/removed in an automated stepwise process until you are left with the variables that best explain the distribution of intestinal enterococci (IE)
- ➡ Model  $\text{Log}_{10}\text{IE} = (\text{Tide} \times 0.155) + (\text{Day} \times 0.003) + (\text{Rain} \times 0.033) + (\text{Wind} \times 0.027) + 1.111$
- ➡ Warning issued when  $\text{IE} > 63$  cfu per 100ml

# Multiple Linear Regression (MLR)

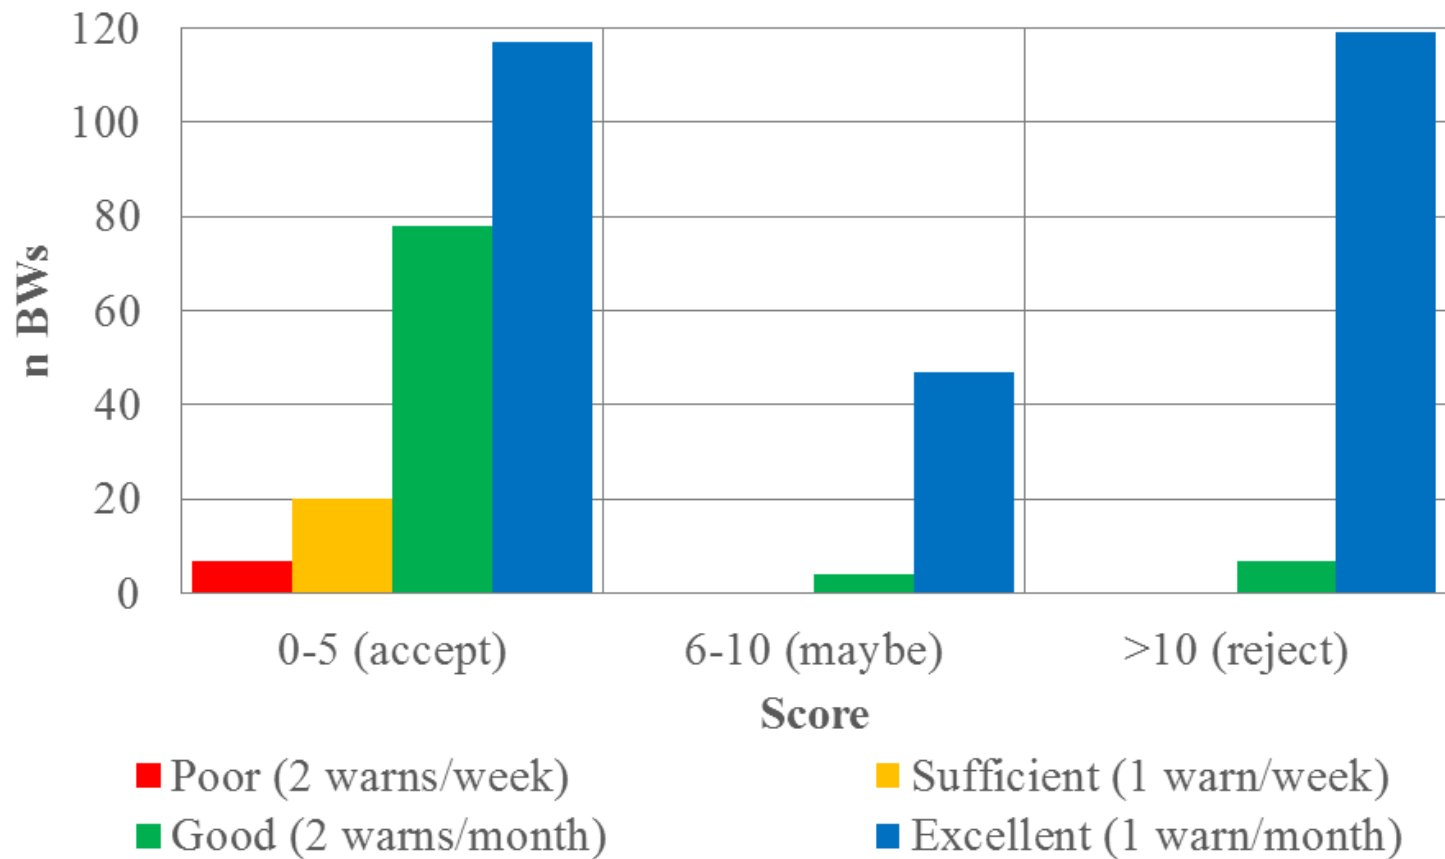

# Assessing MLR Results

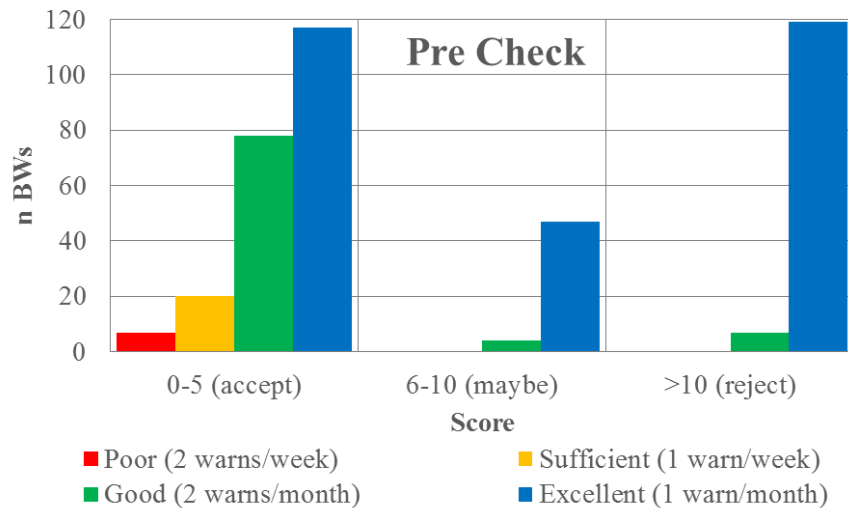

Score	Threshold/Alert	Quality Criteria
30	0	No. of models
10	Yes	Freshwater
1	<100	No. of samples
2	<20%	%age samples >limit of detection
1	>20% and ≤50%	
2	<5%	%age samples >10% health risk
1	>5% and <10%	
7	>30	Condition index
1	>15 and ≤30	
2	≤0.1	Adjusted $r^2$
1	>0.1 and ≤0.25	
2	>0.2	Min or Max 10% of probability plot
1	>0.1 and ≤0.2	
2	>0.3	Maximum of probability plot
1	>0.1 and ≤0.3	
10	0	%age correct warnings
2	>0% and <10%	
1	≥10% and >25%	

# Assessing MLR Results

# Local Expert Checks and Site Selection

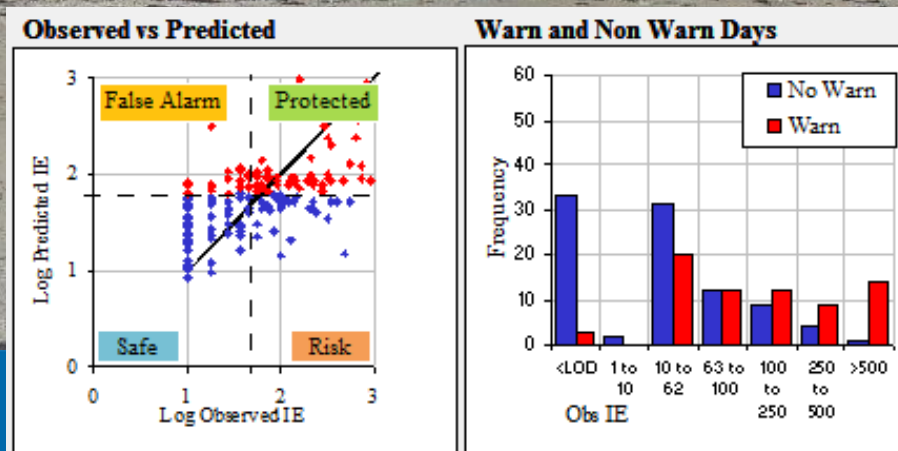

- ➡ Do our models match local knowledge?
- ➡ Has the model selected appropriate variables that reflect potential polluting conditions.
- ➡ Useful tools for planning investigations.

➡ We only accept the strongest models.

$$\text{Log}_{10} \text{IE} = (24\text{hr Rain} \times 0.04) + (3\text{hr Onshore Wind} \times 0.052) + (\text{Tidal Height} \times 0.071) + (6\text{hr Rain} \times 0.096) + 1.249$$

# Within Day Bacteri Variation

➡ MLR equations used to calculate hourly IE levels throughout 2016 (dry) and 2017 (wet) bathing seasons

# 2020 BW Forecasting System

- ➡ Hosted on our new flood forecasting system
- ➡ Live and forecast data feeds
- ➡ Daily composite prediction at 08:30, using hourly forecast data up to 17:00
- ➡ Data capture, manual overrides

# 2020 Site List
